IS BOUND TO ERSE.
SUBDUIT: HOWODIMER AND HETERODIMER WITH ATF6-ALPHA. THE DIMER INTERACTS WITH THE NUCLEAR TRANSCRIPTION FACTOR Y (NF-Y) TRIMER THROUGH DIRECT BINDING TO NP-Y SUBUNIT C (NF-YC).
SUBCELLUIAR LOCATION: Type II membrane protein in the endoplasmic exteinlum. Under ER stress the cleaved N-terminal cytoplasmic domain translocates into the nucleus.
ALTERNAIVE PRODUCTS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PTM: N-glycosylated.

PTM: DURING UNFOLDED PROTEIN RESPONSE AN APPROXIMATIVE 60 KDA FRAGMENT CONTAINING THE CYTOPLASMIC TRANSCRIPTION FACTOR DOMAI SELEARED BY ROCITOLYSIS. THE CLEAVAGE IS PROBABLY PERFORMED SEQUENTIALLY BY SITE-1 AND SITE-2 PROTEASES.
SIMILARITY: Belongs to the bzip family. ATF subfamily.

GAUTION: SOME REF. 4 SEQUENCES DIFFER FROM THAT SHOWN DUE TO A FRAMESHIFT IN POSITION 600.
                                                                                                                                                                                                                                                                                                                                                                                                                                 Isoid=Q99941-2; Sequence=VSP_000593;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      lesions (By similarity).
SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
SIMILARITY: Belongs to the ABC transporter family. UvrA subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ikeda H., Ishikawa J., Hanamoto A., Shinose M., Kikuchi H., Shiba T., Sakaki Y., Hattori M., Omura S.;
"Complete genome sequence and comparative analysis of the industrial microorganism Streptomyces avermitilis.";
Nat. Biotechnol. 21:526-531(2003)
-!-FUNCTION: The UvrABC repair system catalyzes the recognition and processing of DNA lesions. UvrA is an ATPase and a DNA-binding processin. A damage recognition complex composed of 2 uvrA and 2 uvrB subunits scans DNA for abnormalities. When the presence of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PROSITE; PS00211; ABC_TRANSPORTER_1; 2.

UVTA is an ATPase and a DNA-binding protein. A damage recognition complex composed of 2 uvrA and 2 uvrB subunits scans DNA for abnormalities. When the presence of lesion has been verified by uvrB, the uvrA molecules dissociate

-!- CATALYTIC ACTIVITY: ATP + H(2)O = ADP + phosphate.
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- SIMILARITY: Belongs to the cation transport ATPases family (P-type ATPases). Subfamily IV.

Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).
-!- CATALYTIC ACTIVITY: ATP + H(2)O = ADP + phosphate.
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- TISSUE SPECIFICITY: Found in most tissues except spleen and muscle. Most abundant in testis. Also detected in fetal tissues.
-!- SIMILARITY: Belongs to the cation transport ATPases family (P-type ATPases). Subfamily IV.
                                                                                                                                                                                                                                                                                            STRAIN=ICR; TISSUE=Brain;

       "Determination of the intramolecular disulfide bond arrangement and blochemical identification of the glycosylation sites of the nonstructural protein NS1 of Murray Valley encephalitis virus.";
J. Gen. Virol. 82:2251-2256(2001).
-!- FUNCTION: The small proteins NS2A, NS2B, NS4A and NS4B are hydrophobic, suggesting a possible membrane-related function. NS3 and NS5 may play a role in the viral RNA replication.
-!- CATANYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1.
-!- SUBNUIT: The virion of this virus is a nucleocapsid covered by a lipoprotein envelope. The envelope consists of two proteins: protein RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            R Pfam; PF00103; Flavi_capsid; 1.

CATALYTIC ACTIVITY: COA + apo-[acyl-carrier protein] = adenosine 3', 5'-bisphosphate + holo-[acyl-carrier protein].

COPACTOR: Magnesium (By similarity).

SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

SIMILARITY: Belongs to the P-Pant transferase superfamily. AcpS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             10-0CT-2003 (Rel. 42, Created)

"VEGI, a novel cytokine of the tumor necrosis factor family, is an angiogenesis inhibitor that suppresses the growth of colon carcinomas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -!- SUBUNIT: Homotrimer (Potential).
-!- SUBCELLULAR LOCATION: Type II membrane protein (Probable).
-!- TISSUE SPECIFICITY: Specifically expressed in endothelial cells.
Detected in placenta, lung, kidney, skeletal muscle, pancreas, spleen, prostate, small intestine and colon.
-!- SIMILARITY: Belongs to the tumor necrosis factor family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                095150;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ambler R.P., Daniel M., Melis K., Stout C.D.,
"The amino acid sequence of the dihaem cytochrome c4 from the
Bacterium Azotobacter vinelandii.";
Biochem. J. 222:137-227 [1984].
-!- FUNCTION: DIHEME, HIGH POTENTIAL CYTOCHROME C BELIEVED TO BE AN
INTERMEDIATE ELECTRON DONOR TO TERMINAL OXIDATION SYSTEMS.
-!- SUBCELLULAR LOCATION: Periplasmic.
-!- PTM: Binds 2 heme groups per molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PROSITE; PS00350; MADS BOX 1; 1.

Nat. Biotechnol. 20:1118-1123(2002).

-!- FUNCTION: Catalyzes the condensation of 1-deoxy-D-xylulose-5-phosphate (DXP) and 1-amino-3-(phosphohydroxy)propan-2-one to form pyridoxine 5-phosphate (PNP) (By similarity).

-!- PATHWAY: De novo synthesis of pyridoxine (vitamin B6) and pyridoxal phosphate.

-!- SUBCELLULAR LOCATION: Cytoplasmic (Probable).

-!- SIMILARITY: Belongs to the pdxJ family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Immunogenetics 53:315-328(2001).
Immunogenetics 53:315-328(2001).
PUNCTION: Cytokine that binds to TNFRSF5. Mediates B-cell proliferation in the absence of co-stimulus as well as IgE production in the presence of IL-4. Involved in immunoglobulin class switching (By similarity).
SUBCELLUIAR LOCATION: Type II membrane protein. Also exists as extracellular soluble form (By similarity).
FM: The soluble form derives from the membrane form by proteolytic processing (By similarity).
SIMILARITY: Belongs to the tumor necrosis factor family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Aotus trivirgatus (Night monkey) (Douroucouli).

                     class switching (By similarity).
--- SUBUNIT: Homotriner (By similarity).
--- SUBUNIT: Homotriner (By similarity).
--- SUBCELLUIAR LOCATION: Type II membrane protein. Also exists as an extracellular soluble form (By similarity).
---- PIM: The soluble form derives from the membrane form by proteolytic processing (By similarity).
---- SIMILARITY: Belongs to the tumor necrosis factor family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              01.AUG-1990 (Rel. 15, Last sequence update)

"Cloning of a putative chicken CD40 ligand.";
Submitted (MAR-2003) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Cytokine that binds to TWRRSF5. Mediates B-cell
proliferation in the absence of co-stimulus as well as IgE
production in the presence of LL-4. Involved in immunoglobulin
class switching (By similarity).
-!- SUBUNIT: Homotrimer (By similarity).
272 AA.

-1- FUNCTION: Removes the formyl group from the N-terminal Met of newly synthesized proteins (By similarity).

-1- CATALYTIC ACTIVITY: Formyl-L-methionyl peptide + H(2)0 = formate methionyl peptide.

-1- COPACTOR: Bindel i iron(II) ion (By similarity).

-1- COPACTOR: Bindel i iron(II) ion (By similarity).

-1- SIBGELMULAR LOCATION: Chloroplast (Potential).

-1- SIMILARITY: Belongs to the polypeptide deformylase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

-!- FUNCTION: Plays a complex role in regulating the basal catalytic activity of the alpha subunit (By similarity).

-!- SUBUNIT: Tetramer composed of an alpha chain, an alpha', one beta chain and one beta' chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      -!- PTM: Phosphorylated by alpha chain (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       EMBL; U03984; AAA53234.1; -. Probable diphthine synthase (EC 2.1.1.98) (Diphthamide biosynthesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      biosynthesis.
-!- CATALYTIC ACTIVITY: S-adenosyl-L-methionine + 2-(3-carboxy-3-aminopropyl)-L-histidine = S-adenosyl-L-homocysteine + 2-[3-carboxy-3-(methylammonio) propyl]-L-histidine.
-!- PATHWAY: Diphthamide biosynthesis; second step.
-!- SIMILARITY: Belongs to the diphthine synthase family.
                                                                                                                                                                                                                       Schizosaccharomyces pombe (Fission yeast).

-!- FUNCTION: Involved in the biosynthesis of lipid A, a phosphorylated glycolipid that anchors the lippolysaccharide to the outer membrane of the cell (By similarity).

-!- CATALYTIC ACTIVITY: UDP-3-0-(3-hydroxytetradecanoyl)-N-acetylglucosamine + H(2)0 = UDP-3-0-(3-hydroxytetradecanoyl)-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MEDLINE=22569155; PubMed=12682364;
